Lisa Chen PID a17082974

## The PDB database

Here we examine the size and composition of the main database of biomolecular structures- the PDB

Get a CSV file from the PDB database and read it into the R.

```
pdbstats <- read.csv("Data Export Summary.csv", row.names=1)
head(pdbstats)
```

	X.ray	EM	NMR	Multiple.methods	Neutron	Other
Protein (only)	161,663	12,592	12,337	200	74	32
Protein/Oligosaccharide	9,348	2,167	34	8	2	0
Protein/NA	8,404	3,924	286	7	0	0
Nucleic acid (only)	2,758	125	1,477	14	3	1
Other	164	9	33	0	0	0
Oligosaccharide (only)	11	0	6	1	0	4
Total						
Protein (only)	186,898					
Protein/Oligosaccharide	11,559					
Protein/NA	12,621					
Nucleic acid (only)	4,378					
Other	206					
Oligosaccharide (only)	22					

Q1: What percentage of structures in the PDB are solved by X-Ray and Electron Microscopy.

My pdbstats data frame has numbers with commas in them. This may cause us problems. Let's see:

```
pdbstats$X.ray
```

```
[1] "161,663" "9,348" "8,404" "2,758" "164" "11"
```

```
as.numeric(pdbstats$X.ray)
```

Warning: NAs introduced by coercion

```
[1] NA NA NA NA 164 11
```

We found a function called 'gsub()' now we can figure out how it works

```
x <- "22,200"
as.numeric(gsub(",", "", x))
```

```
[1] 22200
```

I can turn this snippet into a function that I can use for every column in this table

```
commasum <- function(x) {
  sum(as.numeric(gsub(",", "", x)))
}

commasum(pdbstats$X.ray)
```

```
[1] 182348
```

Apply across all columns

```
totals <- apply(pdbstats, 2, commasum)
totals
```

X.ray	EM	NMR	Multiple.methods
182348	18817	14173	230
Neutron	Other	Total	
79	37	215684	

```
round(totals/totals["Total"]*100, 2)
```

X.ray	EM	NMR	Multiple.methods
84.54	8.72	6.57	0.11
Neutron	Other	Total	
0.04	0.02	100.00	

Q2: What proportion of structures in the PDB are protein?

```
(215684/249751891 *100)
```

[1] 0.08635931

## #2 Visualizing Protein Structure

We will learn the basics of Mol\* (mol-star) homepage: <https://molstar.org/viewer/>

We will play with PDB code 1HSG

Figure 1. HIV-1 protease structure in complex with the small molecule indinavir.

##Back to R and working with PDB structures

Predict the dynamics (flexibility) of an important protein

```
library(bio3d)  
hiv <- read.pdb("1hsg")
```

Note: Accessing on-line PDB file

```
hiv
```

Call: `read.pdb(file = "1hsg")`

Total Models#: 1

```

Here we will do a Normal Mode analysis to predict functional motions of a kinase protein

```
adk <- read.pdb("6s36")
```

Note: Accessing on-line PDB file

PDB has ALT records, taking A only, rm.alt=TRUE

```
adk
```

Call: read.pdb(file = "6s36")

Total Models#: 1

Total Atoms#: 1898, XYZs#: 5694 Chains#: 1 (values: A)

Protein Atoms#: 1654 (residues/Calpha atoms#: 214)

Nucleic acid Atoms#: 0 (residues/phosphate atoms#: 0)

Non-protein/nucleic Atoms#: 244 (residues: 244)

Non-protein/nucleic resid values: [ CL (3), HOH (238), MG (2), NA (1) ]

Protein sequence:

```

MRIILLGAPGAGKGTQAQFIMEKYGIPQISTGDMRLRAAVKSGSELGKQAKDIMDAGKLVT
DELVIALVKERIAQEDCRNGFLLDGFPRITIPQADAMKEAGINVDYVLEFDVPDELIVDKI
VGRRRVHAPSGRVYHVKFNPVKVEGKDDVTGEELTTRKDDQEETVRKRLVEYHQMTAPLIG
YYSKEAEAGNTKYAKVDGTPVAEVRADLEKILG

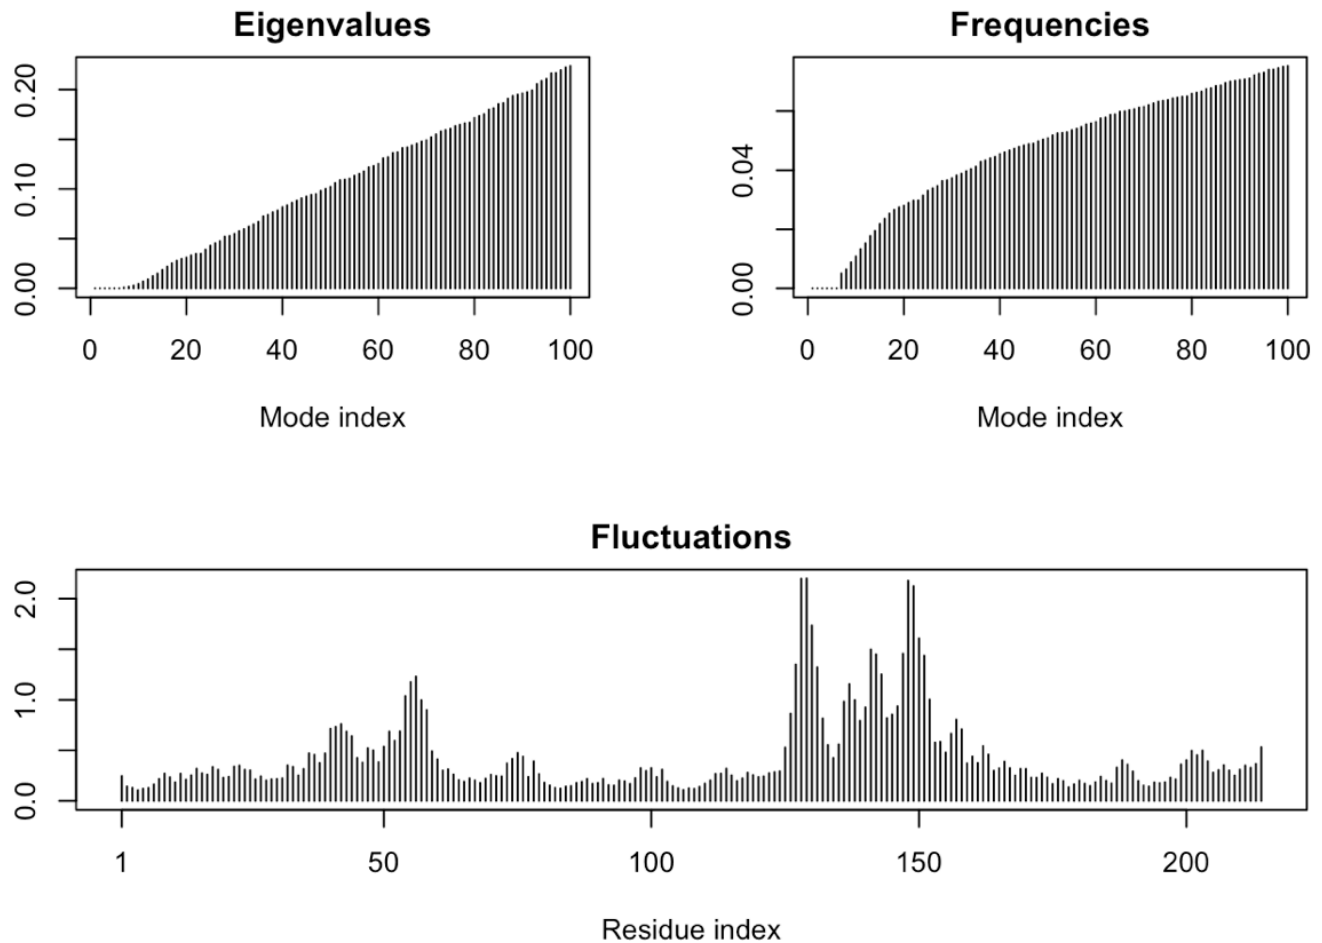

```

```
+ attr: atom, xyz, seqres, helix, sheet,
      calpha, remark, call
```

```
modes <- nma(adk)
```

```
Building Hessian...      Done in 0.016 seconds.  
Diagonalizing Hessian... Done in 0.275 seconds.
```

```
plot(modes)
```

Make a "movie" called a trajectory of the predicted motions:

```
mktrj(modes, file="adk_m7.pdb")
```

Then I can open this file in Mol\* ....
