##R Functions
All functions in R have at least three things:
  • A name ( we get to pick this)
  • One or more Input arguments (the input to our function)
  • The Body (lines of code that do the work)
 #/ eval: false
 funname <- function(input1, input2) {</pre>
 #The body with R code
Let's write a silly first function to add two numbers
 x <- 5
 y <- 1
 x + y
```

```
Functions are how we get stuff done. We call functions to do everything useful in R.
One cool thing about R is that it makes writing your own functions comparatively easy.
[1] 6
 addme <- function (x, y=1) {
   x + y }
 addme(100, 100)
 [1] 200
 addme(10)
[1] 11
##Lab for today
write a function to grade student work from class.
Start with a simplified version of the problem
 # Example input vectors to start with
 student1 <- c(100, 100, 100, 100, 100, 100, 90)
 student2 <- c(100, NA, 90, 90, 90, 90, 97, 80)
 student3 <- c(90, NA, NA, NA, NA, NA, NA, NA)
 mean((student1))
 [1] 98.75
 mean(student2, na.rm=TRUE)
[1] 91
 mean(student3, na.rm=TRUE)
[1] 90
This is not fair- there is no way students3 should have a mean of 90!
Come back to this NA problem. But things worked for 'student 1'.
We want to drop the lowest score before getting the 'mean()'
How do I find the lowest (minimum) score?
 min(student1)
 [1] 90
I found the 'which.min()' function. Maybe this is more useful?
 which.min(student1)
[1] 8
Cool- it is the 8th element of the vector that has the lowest score. Can I remove this one?
 student1[which.min(student1)]
[1] 90
We can use the wee minus trick for indexing
 x < -1:5
 x[-3]
[1] 1 2 4 5
now put these bits of knowledge together to make some code that identifies and drops the lowest score
(element of the input vector) and then calculates the mean.
 #Find the lowest score
 ind <- which.min(student1)</pre>
 #remove lowest score and find mean
 mean(student1[-ind])
[1] 100
Use a common shortcut and use 'x' as my input
 x <- student1
 mean(x[-which.min(x)])
```

[1] 100

y <- 1:5

[1]

y==NA

У

is.na(y)

!c(F,F,F)

#y[is.na(y)]

y[!is.na(y)]

[1] 1 2 4 5

У

[1]

[1] TRUE TRUE TRUE

y [is.na(y)] <- 10000

1

#Change NA values to Zero

such as this one in CSV format

grade <- function(x) {</pre>

mean(x[-which.min(x)])

 $x[is.na(x)] \leftarrow 0$

grade(student1)

grade(student2)

grade(student3)

head(gradebook)

results

91.75

93.75

78.75

the gradebook?

which max(results)

18

the lowest scores overall? [2pts]

hw2

#amek all (or mask) NA to zero

We can use 'cor()' function for correlation analysis

mask <- gradebook</pre>

mask[is.na(mask)] <- 0</pre>

cor(mask\$hw5, results)

cor(mask\$hw3, results)

apply(mask, 2, cor, results)

hw2

student-4 88 NA 73 100 76

student-5 88 100 75 86 79

student-6 89 78 100 89 77

gradebook <- read.csv(url, row.names = 1)</pre>

[1] 12.85714

[1] 100

[1] 91

#Change NA values to Zero

#find and remove min value and get mean

mean(x[-which.min(x)])

OK lets solve this

x <- student3

[1] 12.85714

 $x[is.na(x)] \leftarrow 0$

2 10000

#find and remove min value and get mean

y[y==3] < -10000

1

[1] NA NA NA NA NA

[1] 1 2 NA 4 5

Bummer, this is no good...

 $y \leftarrow c(1, 2, NA, 4, 5)$

We still have the problem of missing values

2 10000

[1] FALSE FALSE TRUE FALSE FALSE

How can I remove the NA elements from the vector?

5

5

Write a function grade() to determine an overall grade from a vector of student homework

Last step now that I have my working code snippet is to make my 'grade()' function.

assignment scores dropping the lowest single score. If a student misses a homework (i.e. has an

NA value) this can be used as a score to be potentially dropped. Your final function should be

adquately explained with code comments and be able to work on an example class gradebook

One idea is to replace NA values with 0.
